Products without a price

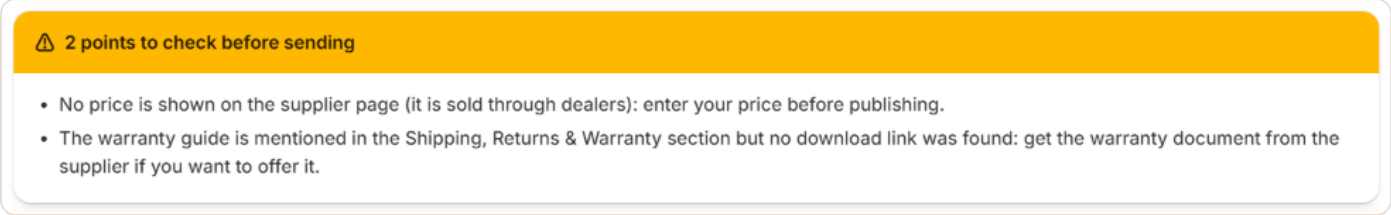

Many manufacturers do not show prices on their website. They sell through dealers, with a *Locate a dealer* or *Request a quote* button instead of a price.

The app copies everything else from the page: photos, tabs, documents, SKU. It **never invents a price**, so the product arrives without one, and it is protected until you set yours.

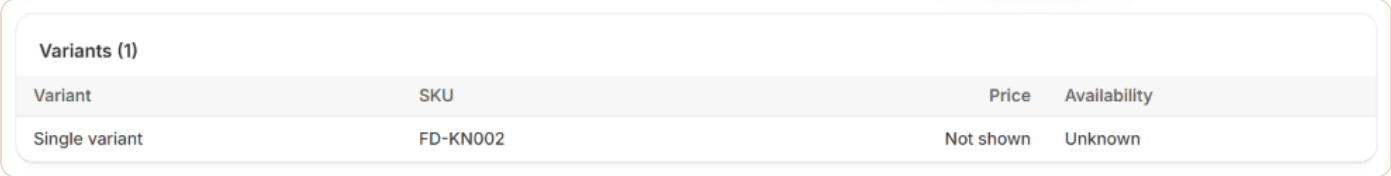

> **Watch it in under a minute:** Products without a price on the supplier page (video).

Before sending

The import shows a point to check, written for this product. For example:

In **Variants**, the price reads **Not shown**.

You can still send the product. You set the price in Shopify afterwards.

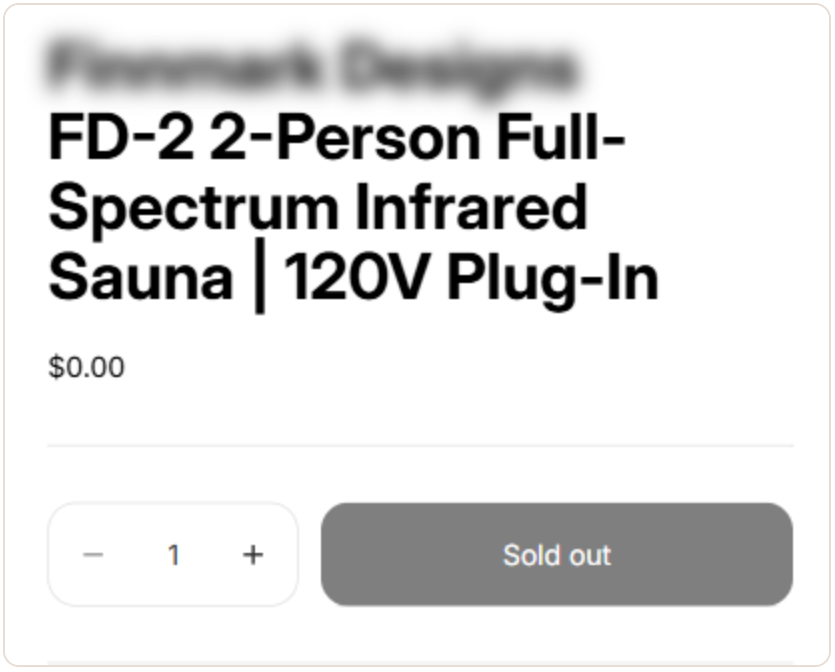

When you send it

The product is created as a **draft**, with:

- a price of **$0.00**;
- **Inventory tracked** turned on, with **0** in stock.

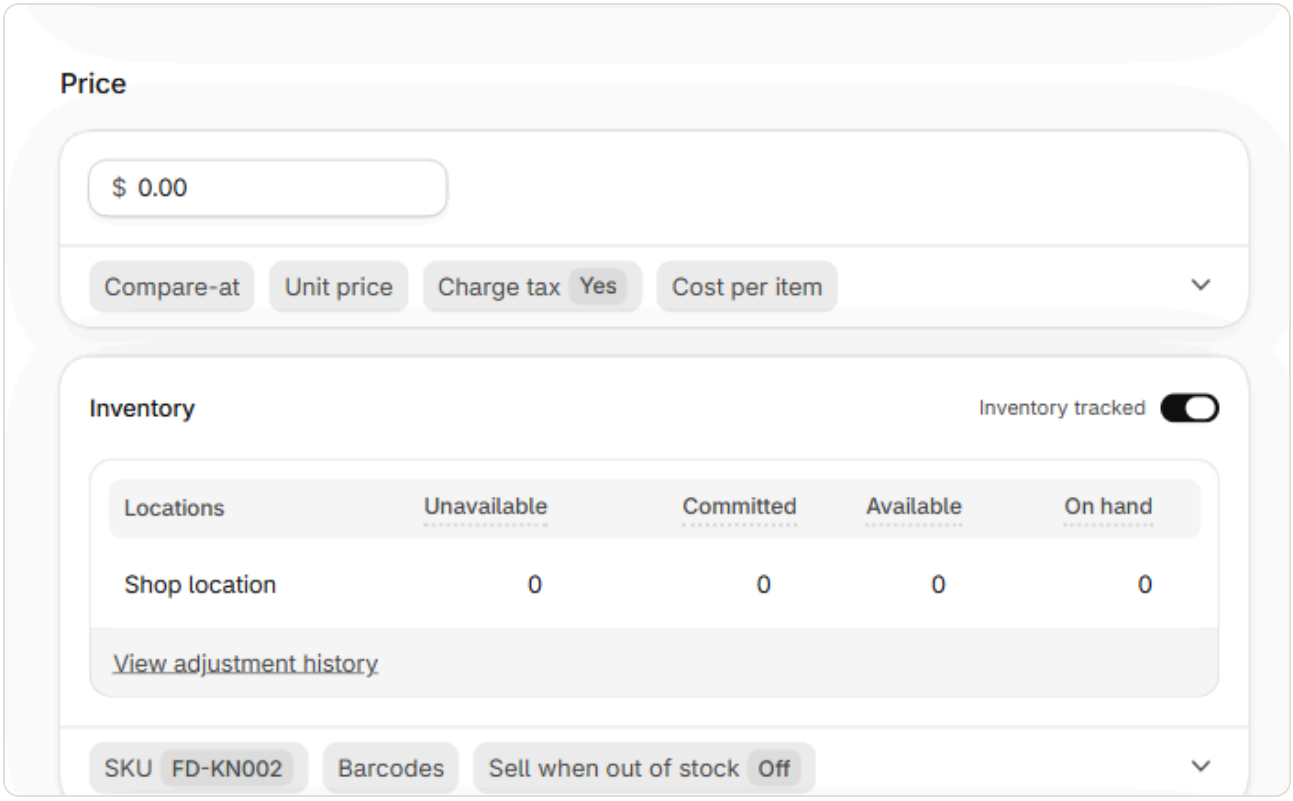

So the product shows as **Sold out**. Nobody can buy it at $0.00, even if it is made active by mistake. After sending, a yellow box reminds you what to do.

If the product is made active before you set a price, shoppers see this:

Put it on sale

1. In the app, click **Open the product in Shopify**.
2. In **Price**, enter your selling price. If the product has several variants, enter the price of each one.
3. In **Inventory**, choose one of these:
   - turn off **Inventory tracked**: the product can always be bought. This suits products the supplier ships to your customer;
   - keep it on and enter your stock in **On hand**;
   - keep it on and turn on **Sell when out of stock**.
4. Click **Save**.
5. When you are ready, change the **Status** to **Active**.

Good to know

- **Only the variants without a price** are sent as Sold out. The others are sent with their price.
- **The app reads the public page of the supplier.** Your own dealer price is not on it. You can keep it in **Cost per item**, under the price, to follow your margin in Shopify.
- **The app never changes a price.** A price shown by the supplier is copied as it is.
