SOVBA AI SOLUTIONS

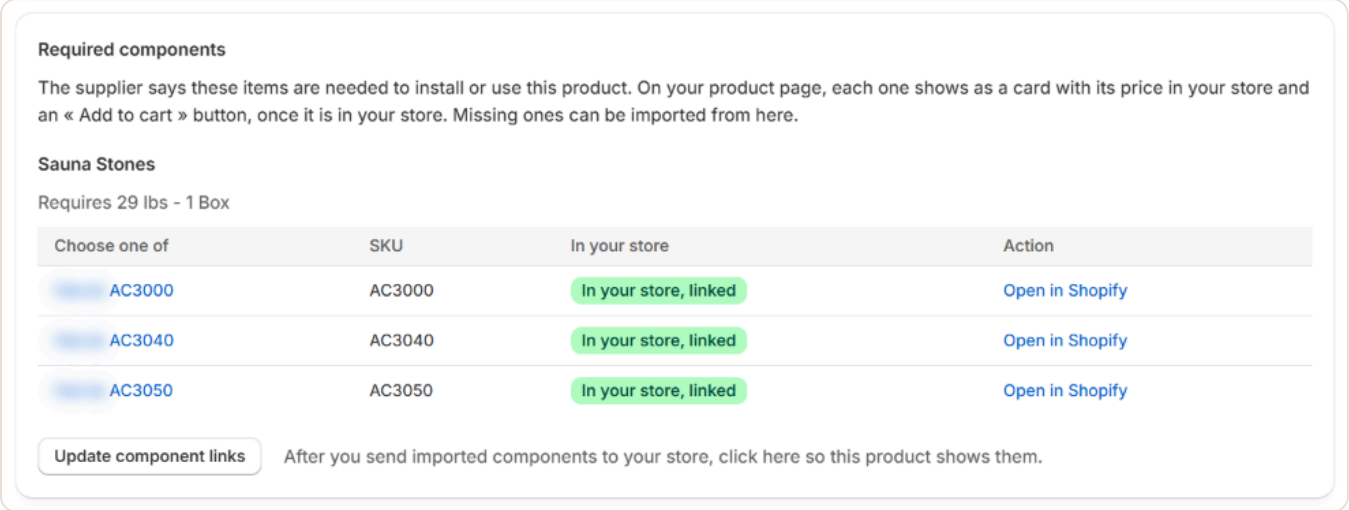

# Required components

Many high-ticket products need other products to work. A sauna heater needs stones and a control unit, and a gas fire pit needs a burner kit. Suppliers list them on the product page as *required* or *sold separately*.

The app reads them and shows them to your shoppers **right after the price**, as cards with an **Add to cart** button. Your customers buy everything they need in one order, and you sell more per order.

## What the app reads

On the page of an import, the **Required components** section lists the components found on the supplier page, in groups. For example: *Sauna Heater Controls*, then *Sauna Stones*. When a group offers several choices, the table reads **Choose one of**.

For each component, the **In your store** column shows where it is:

| Status | What it means | Action |
|---|---|---|
| **In your store, linked** | The component is in your store and linked to this product. | **Open in Shopify** |
| **Not in your store** | You do not sell it yet. | **Import** |
| **Reading** | The app is reading its supplier page. The page updates on its own. | *About a minute…* |
| **Read, not sent yet** | It was read, and it waits for you to review and send it. | **Review and send** |
| **Not read** | Its page could not be read. The reason is written under the button. | **Read again** |

## Import a missing component

1. Click **Import** next to the component. The app reads its supplier page, which takes about a minute.
2. Click **Review and send**. The component opens like any import: check it, then click **Send to my store as a draft**.
3. The back arrow takes you back to the product you started from.
4. In Shopify, make the component **active**, as you do for any product.

When the component is sent, the app **links it automatically** to every product that needs it. The order does not matter: you can send the heater first and the stones later, or the other way around.

## How the app finds components already in your store

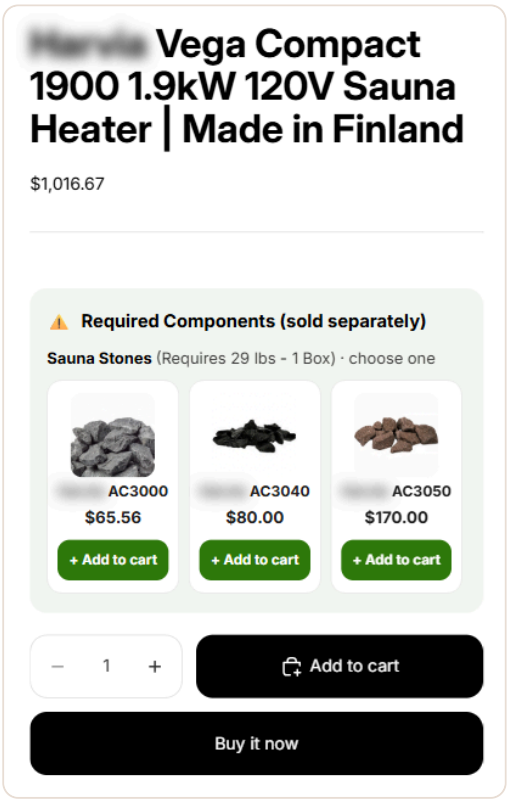

A component is linked automatically if:

- you sent it with the app, from its supplier page; or
- a product in your store has **the same SKU** as the component on the supplier page.

If you added a component to your store another way (by hand, or with another app), open the product that needs it and click **Update component links**.

## What shoppers see

Each component shows as a card with its photo, its name, **your store's price** and a **+ Add to cart** button. A card appears once that component is **active** in your store.

To show the cards, **Components and tabs** must be turned on in your theme. See the guide *Show tabs and components on your store*. You can change the heading, the card size and the colors there.

## Good to know

- **Optional accessories are not copied.** Only the components the supplier marks as required are. To suggest accessories, use a section of your theme or the Shopify Search & Discovery app.
- **The price on the card is your price**, the one of the component product in your store.
- **Nothing is sent without you.** Clicking **Import** only reads the page. The component reaches your store when you click **Send to my store as a draft**.
- **A component you send is monitored like any product**: the app checks its supplier page every week. See the guide *Monitor your suppliers*.
- **Each component you import counts as one import of your plan**, like any product. A heater with 3 stone choices is 4 imports if you import them all. See the guide *Your plan and imports*.
